Date: 12/19/2005 10:05:27 PM Pacific Standard Time
From: juliew@familytreedna.com
To: Stoneyjax75@aol.com

Dear Valued Customer,

Thank you very much for your order. As you know, every two weeks the

tests are sent to the lab for processing. If you would like us to include your last order for Kit # 47864 in the batch that goes out this weekend, we will need to receive payment before this Wednesday. You have ordered a

Y-DNA37 test and the amount to be paid is \$221.00. If a portion of your

test was paid with funds from your Surname General Fund, please deduct it

from the amount that you are paying, or call our office for the correct amount to be paid. You can pay for it here:

https://www.familytreedna.com/invoice_payment.asp?kit=47864&amount=221

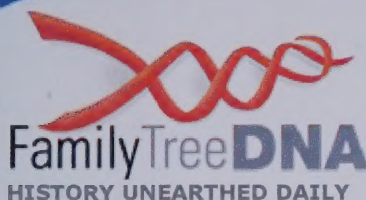

or contact us at 713-868-1438 with your credit card information by close of business Thursday, December 22, 2005. If someone else intended

to pay for this order please have them get in touch with us or send their contact information to juliew@familytreedna.com.

Thank you for your attention to this matter.

Thank you very much for your order!

We have collected the following information from you. If you are a new customer then your DNA test kit will be sent to the address below. If you are a returning customer then your test will be run and the results sent to the address below. Please note, all correspondence will be via email unless you have not supplied your email address. This would, of course, dramatically slow down our response. To include other information in our database please send an email to: cmcd@FamilyTreeDNA.com.

 To: Stoneyjax75@aol.com

You are my kind of researcher - research the complete family before going to the next generation - it sure does help.

61606 – Robert Loring Jackson Y-DNA 1-37 – RESULTS: - HAPLOGROUP: - ANCESTORS: Olin DeBuhr Jackson b. Aug 12, 1893 Winnebago, Winnebago Co., IL d. June 25 1972 Minneapolis, Hennepin Co., Minn., m. Edna Anna Hanson, Apr 5, 1919, Parker, Turner Co., SD > Orin Porter Jackson b. Jan 29, 1869 Winnebago, Winnebago Co, IL, d. Aug 28, 1924, Mitchell Davison Co., SD, m. Marie DeBuhr Apr 6, 1892, Winnebago, Winnebago Co., IL > John Alexander Jackson b. June 4, 1843 Bath, Summit Co., Ohio, d. Aug 10, 1910 Winnebago, Winnebago Co., IL, m. Camilla Carferilla Lawrence Nov 17, 1864 > Asahel Hyde Jackson b. July 29, 1892, New Concord, East Chatham, Columbia Co., NY, d. May 4, 1862 m. Phoebe Sherman Lawrence, July 16, 1829 > Alexander R. Jackson b. Feb 6, 1785 d. Jan 15, 1864 (this lineage also contains extensive info on siblings for each of the "direct line Jacksons listed above – lucky person who matches! – PARENTAL COUNTRY OF ORIGIN: England – MEMBER SINCE: 4/22/06 -----Any corrections/additions?

after Alexander R. Jackson, please add Elias Jackson, Jr b. Dec 31, 1760

Below, you will find status of how your kit is progressing - it still has two more stages to go. -- I'm guessing you have about a month to go - the Estimated date for the first twelve markers was set for 6/23/06 with the remainder 13-37 for 7/07/06. The lab is running behind due to an influx of upgrades to the new 59 markers (now raised to 66 markers plus the new DeepClade SNP test (new refined test to determine Haplogroup), as well as new members - they "double" check the results for accuracy. When I first joined years ago, I thought I would never receive the results. When they did come in, to me, it was like another Christmas!

Kit Received	05/04/2006
Batch 152 created	05/10/2006
DNA Isolation began	05/13/2006
DNA at Sequencing facility	
Quality Control began	

Once you receive your results, be sure and join (free) by sending your results to Y-Search (a FTDNA affiliate) which is available to all researchs on an international basis. Also, you might consider joining the GenoProject, an anthropology project of the National Geographic Society - go to <http://nationalgeographic.com> and read about this project - - using your results, they can provide you with the geographic area and migration route of your ancient ancestral line. The cost is small (\$10-\$15) with the money going direct to the project - It is NEAT - you also will be able to down load the migration route of your ancestral line, down a full explanation of where originated as well as a Certificate on which you can insert your own name, make additional copies for relatives inserting their name, etc. I printed off copies on photo paper and gave to some relatives this past Christmas as a "little extra" - they were in awe! You can join both through your Personal FTDNA page which will be available to you when your results are in. Check each link out - good informative data included.

Thank you so very much for your prompt reply - I still have to go back to some of the old members (about 10) who have yet to submit their lineage. As mentioned previously, I agreed to help Mary Ann, the Jackson Group DNA Administrator the later part of March of this year, and am to the point of trying to get "all blanks filled in"

Monday, May 22, 2006 America Online: Stoneyjax75

Will upload your information as soon as I send this msg. You will be able to see it online at <http://www.familytreedna.com/public/Jackson> Should you have any questions, please let me know - if I do not know the answer, I sure will find out for you.

Evyonne

Subject: Re: Kit #61606 FTDNA

The following genealogy was prepared by my father and verified by additional research. I have extensive information on the siblings for each of the "direct line" Jacksons listed below. Let me know if that would be helpful to the project in gathering additional information.

Father: Olin DeBuhr Jackson

- b. August 12, 1893, Winnebago, Winnebago, Illinois**
- d. June 25, 1972, Minneapolis, Hennepin, Minnesota**
- m. Edna Anna Hanson, April 5, 1919, Parker, Turner, South Dakota**

Grandfather: Orin Porter Jackson

- b. January 29, 1869, Winnebago, Winnebago, Illinois**
- d. August 28, 1924, Mitchell, Davison, South Dakota**
- m. Marie DeBuhr, April 6, 1892, Winnebago, Winnebago, Illinois**

G. Grandfather: John Alexander Jackson

- b. June 4, 1843, Bath, Summit, Ohio**
- d. August 10, 1910, Winnebago, Winnebago, Illinois**
- m. Camilla Carferilla Lawrence. November 17, 1864**

G. G. Grandfather: Asahel Hyde Jackson

- b. July 29, 1802, New Concord, East Chatham, Columbia, New York**
- d. May 04, 1862**
- m. Phoebe Sherman Lawrence, July 16, 1829**

G. G. G. Grandfather: Alexander R. Jackson

b. February 06, 1785

d. January 15, 1864

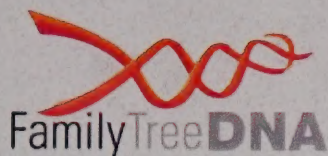

m.

G. G. G. G. Grandfather: Elias Jackson, Sr.

b. December 31, 1760

d. November, 1830

m. Nancy Alexander, September 14, 1780

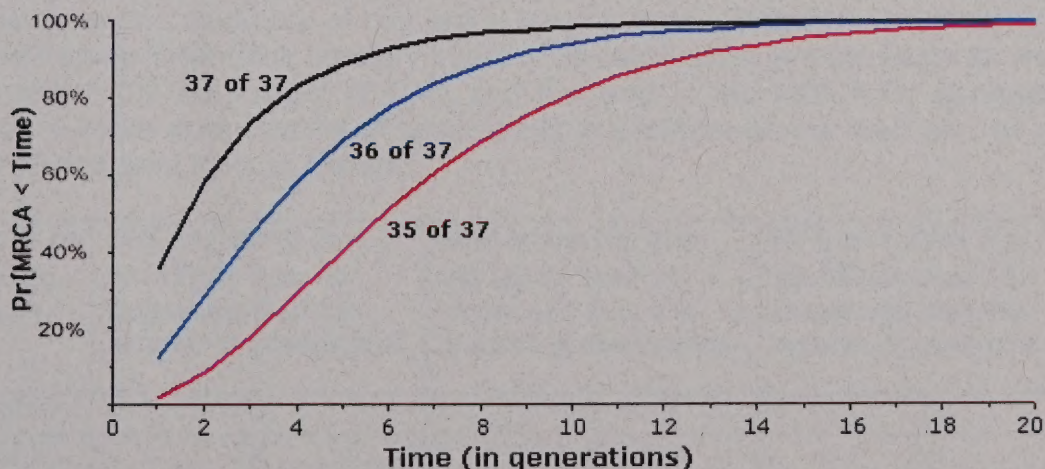

Understanding your 37 markers

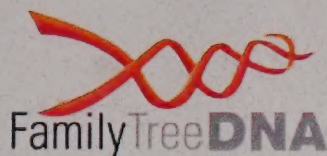

My FTDNA Password: V5463

Enclosed you will find a certificate showing that you have had your Y chromosome DNA analyzed by **Family Tree DNA**. The results represent your actual allele values for 37 locations on the Y chromosome, and are listed on your certificate. All 37 values are listed on your personal page at the web site. To access your personal page, please log in from the MY FTDNA box at the right side of our home page, www.familytreedna.com, with your kit number and password provided at the top of this page.

You can compare your results to other individuals to see how closely or distantly you may have shared a common ancestor. By referring to your personal page at **Family Tree DNA** you will be able to compare yourself to others that are a match or close match to you. Specifically for genealogists, if you match another person with the same surname or a variant, you have a 99.9% likelihood of sharing a common ancestor with that person in a genealogical time frame. This individual is described scientifically as the Most Recent Common Ancestor (MRCA). Population geneticists then apply a term known as the Most Likely Estimate (MLE) for the time (T) when your MRCA would have lived. However, this is an estimate and in each individual case the actual generation could be nearer or further from the person tested.

The graph: In each case a common ancestor is shared between two individuals. In the case of 37/37 (a perfect match) the common ancestor is considerably more recent. For that reason, many people who share a surname will share a perfect or near perfect match. Many surnames are much older than a few hundred years and two people may share a surname but only match 36/37 or even 35/37. In these cases, as the graph shows, the MLE of when their MRCA lived could be much further back in time. Translation: you are related but probably much more distantly. Remember that this is an estimate, not an exact figure.

Understanding your 37 markers

Since we are all related to one another if we go back far enough in time, it is important to only consider very close matches when we are using DNA to resolve genealogical questions. We have supplied you with both a graph (page one) and a table (below) to help you better understand the information given.

How often a marker changes or mutates varies depending on the marker. Because mutation rates may also vary between families, we provide a conservative estimate of how long ago your MRCA lived. While this may not be as satisfying, it tends to err on the side of producing false negatives rather than false positives. The science of DNA and genealogy is quite new and has been adapted from anthropology, where the MRCA is more flexibly defined.

The table: you are probably focusing on when the MRCA actually lived. We have provided a table below to help you better understand this issue. The table, along with additional information available at our web site, tells you with statistical likelihood the generation when your MRCA would have lived. For example if two people matched exactly, there is a 50% probability that the MRCA was no longer than 2 generations ago and a 90% probability that the MRCA was no longer than 5 generations ago.

For the purposes of scientific discussion, our population geneticist feels that 25 years best expresses a typical generation prior to the Dark Ages and 25 to 30 years per generation for the period thereafter. We have integrated this into our FTDNATiP Calculator, which is our patent-pending time predictor. It is based on Family Tree DNA and the University of Arizona's mutation rate study of 2004 that provided us with benchmark mutation rates on a marker-by-marker basis. This study and the rates it observed form the backbone of the FTDNA-TiP. With it, you can see a personalized prediction of the probable time to the most recent common ancestor you share rather than the approximation in the table below.

Bruce Walsh, Ph.D., noted population geneticist from the **University of Arizona**, provides us with this information. An expert on population genetics and statistical applications and co-author of one of the leading texts in this field, Dr. Walsh sits on the **Family Tree DNA** advisory board. His calculations are the basis for most discussions on the subject of DNA and the time to the MRCA for genealogy today. A more extensive list of calculations is available on our web site, as are additional graphs for your benefit.

Number of matching markers	50% probability that the MRCA lived no longer ago than this number of generations	90% probability that the MRCA lived no longer ago than this number of generations	95% probability that the MRCA lived no longer ago than this number of generations
37 of 37	2	5	7
36 of 37	4	8	10
35 of 37	6	12	14

One feature offered exclusively to our customers is our database of Recent Ethnic Origins. This is a collaborative project between **Family Tree DNA** and the **University of Arizona**. The REO database, accessible from our web site's main page, requires the sample code listed on your certificate and the password at the top of page one. This code should not be shared with others. It will also allow you to order additional tests, or refinements, under your name and using your DNA, from our website.

Ysearch is a public database we have created to aid genealogists who want to compare their results with other individuals worldwide, regardless of the company they tested with. Now that you have your results, you may want to add them to www.Ysearch.org and to a European Forensic database located at www.ystr.org.

Our lab is located at the **University of Arizona** where Michael Hammer, Ph.D., oversees this work as the director of the Genomic Analysis & Technology Core (GATC) facility. Dr. Hammer, who sits on the **Family Tree DNA** advisory board, also holds appointments to the Department of Anthropology and the Department of Ecology. He co-authored the first paper showing that present day 'Cohanim' are descended from a single male ancestor and discovered the marker on the Y-chromosome commonly used in population studies today (YAP marker).

Resolution: Your **Family Tree DNA** test examined 37 specific locations on your Y chromosome. The more genetic markers that are tested, the tighter the accuracy becomes. However, testing a greater number of loci does not increase the chance that you are related to someone. Scientists will tell you that if we go back far enough we are all related. On the other hand, testing a greater number of markers dramatically reduces your projected TMRCA with another person in the case of a match—the essence of most genealogical pursuits.

In the future, we hope to be able to bring forth examples of individuals related to famous persons in history so that researchers will be able to compare themselves. At that time we will begin to list those historical figures and their alleles on our web site for your comparison.

We plan to continue offering innovative ways to trace your families' anthrogenealogy in the future so it would be prudent to return to the web site from time to time to see what new opportunities exist for you. While there remember to search for your surname in our Surnames Database Library to see how our library continues to grow or whether a surname project has been established for your surname.

It has been a pleasure to serve you. If you have questions please visit our web site at www.familytreedna.com and read our ever-expanding FAQ or inquire via email to info@familytreedna.com. For valuable education aids, see www.familytreedna.com/dna101.html.

Useful terms to know:

Allele: one of the different forms of a gene that can exist at a single locus. Since mutations in the allele value occur very slowly with time, one should see the same allele value for a male and his great-grandfather for example.

Chromosomes: bundles of tightly coiled DNA. Humans have 23 paired chromosomes; 22 pairs of autosomes and one pair of sex chromosomes. A single chromosome of each pair is passed from each parent to child.

DNA Y-Chromosome Segment (DYS): a nomenclature system which assigns DYS numbers to newly discovered markers. They are the "names" of each marker.

Gene: the functional and physical unit of heredity passed from parent to offspring.

Haplotype: a genotype of genetically linked loci that are inherited in a block as a single unit.

Haplogroup: branches in the human genetic tree (Phylogenetic tree). They are tied to deep ancestry (think 10,000s or 10s of 1000s of years). Haplogroups are predicted based on 12-marker results and using Dr. Hammer's backbone database and FTDNA's database of individuals who have had their haplogroup confirmed through SNP testing.

Locus (plural-loci): a specific spot in the genome. A variable locus will have several possible alleles.

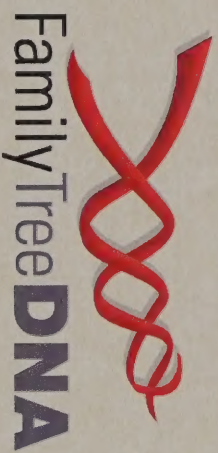

Point Mutation: a change in a single base pair.

REO (Recent Ethnic Origins): A database of countries of origin reported by people who have tested.

Short Tandem Repeat (STR): a region of repetitive DNA with short units of repetition (2 to 6 bases).

TMRCA: the term used by population geneticists to indicate the Time to the Most Recent Common Ancestor shared with another person.

Y-DNA: non-recombining DNA which determines whether a child will be male or female. Y-DNA passes from father to son almost unaltered for long periods of time.

Certificate – Y-DNA

This Certificate confirms that you have had your DNA analyzed by Family Tree DNA. The outcome from each of the thirty-seven Loci examined is reported in the table below.

For your benefit we have listed the Locus designation for all thirty-seven Loci utilized by the geneticists supporting our company. If your alleles for the thirty-seven Loci match another person exactly, then you share the same Haplotype.

Family Tree DNA is a genealogical tool designed to aid individuals wanting to “connect” to other relatives lost in time and where the paper trail no longer exists.

Robert L. Jackson

10 of 12	31	>100	>100

It would be most useful to start by defining some terms.

Point Mutation a change in a single base pair.

STR (Short Tandem Repeat) A region of repetitive DNA with short units of repetition (2 to 6 basis).

TMRCA this term used by population geneticists indicates the Time to the Most Recent Common Ancestor shared with another person.

Locus (plural-loci) a specific spot in the genome. A variable locus will have several possible alleles.

Gene the functional and physical unit of heredity passed from parent to offspring

Y-DNA non-recombining DNA determines whether a child will be a male or female. Y-DNA passes from father to son almost unaltered for long periods of time.

Chromosomes are bundles of tightly coiled DNA. Humans have 23 paired chromosomes (22 pairs of autosomes and a single pair of sex chromosomes). A single chromosome of each pair is passed from each parent to child

Modal comes from the statistical term Mode, which means the value at which an absolute or maximum occurs in the frequency distribution of the variate.

Genotype the actual alleles present in an individual.

Haplotype is a genotype of genetically linked loci that are inherited in a block as a single unit.

Modal Haplotype (MH) Definition: any person who exactly matches the alleles found to be most common (Modal) among the descendants of a person. A person who matches 11 alleles while being 1 allele off in only 1 locus will be considered to be in the haplogroup, rather than in the family haplotype.

Understanding your 12 markers

On your certificate, we have listed 12 of the loci that are utilized by the University of Arizona to determine the degree of relatedness, in both genealogical and anthropological terms, of diverse populations. Michael Hammer, Ph.D., who sits on the Family Tree DNA Advisory Board, oversees this work as the director of the Genomic Analysis & Technology Core (GATC) facility. Dr. Hammer also has appointment to the Department of Anthropology and the Department of Ecology. He co-authored the first paper showing that present day 'Cohanim' are descended from a single male ancestor and is the discoverer of the marker on the Y-chromosome commonly used in population studies today (YAP marker).

Resolution: Your Family Tree DNA test examined 12 specific locations on your Y chromosome. The more genetic markers tested, the tighter the accuracy and greater specificity of the numbers found in the Table on page 3. A greater number of Loci does not increase the chance that you are related to someone. Scientists will tell you that if we go back far enough we are all related, however the greater number of markers tested dramatically reduces your projected TMRCA with another person in the case of a match...the essence of most genealogical pursuits.

Another feature exclusively offered by us to our customers is our database of Recent Ethnic Origins. This is a collaborative project between **Family Tree DNA** and the **University of Arizona**. The REO database, accessible from our web site's main page requires a sample code (listed on your certificate), and a password that was emailed to you in the last few days—also at the top of page one. This code should not be shared with others. It will also allow you to order additional tests, or refinements, under your name and using your DNA, from our website. If you have misplaced your password you may email us at info@familytreedna.com to obtain it.

We have plans to continue to offer new innovative ways to trace your families' anthro-genealogy in the future so it would be prudent to return to the web site from time to time to see what new and innovative opportunities exist for you. While there remember to search for your surname in our Surnames Database Library to see how the Library continues to grow.

It has been a pleasure to serve you. If you have questions please visit our web site at: **FamilytreeDNA.com** and read our ever-expanding FAQ or inquire via email to info@familytreedna.com.

Match Y-DNA results to other Family Tree DNA customers

If you match someone who has signed a Release Form their name(s) and email addresses are shown below. Since this page refers to you, your name and email will not show up here, just people you match. If the same email address appears multiple times then the people listed are members of a group study which has chosen to make the group administrator a single point of contact. Recent matches are at the top of the list. (** indicates additions since your last login.) **Only people who sent us signed release forms are eligible to be listed here.**

If the individuals with whom you have matches have tested for more markers, you will see next to their names, between parenthesis, the number of markers that they have tested for.

GEDCOM Available 

Additional possibilities for searching matches:

While our database is not open to the wide public for privacy reasons, Family Tree DNA has created Ysearch.org as a free public service so that people who have tested with the different companies can compare their results. You will be able to determine what portion of your personal information you want to disclose. Please note that a new user ID will be created for you and you will be asked to choose a new password. This new set of ID/Password is exclusive for Ysearch.org. You will also be given the opportunity to upload your [GEDCOM](#) if you have one.

-

Your Haplogroup has not been determined by a specific test. Use the Haplogroup link on the left to find out about it, and if we were able to predict it.

FTDNA DYS markers

We provide the actual scientific Allele values and DYS #'s for your results unless the markers were discovered at the University of Arizona and do not have a publication schedule. When that situation occurs we provide your results in "scores" to allow us to use the marker without compromising the discoverer until publication dates have been established.

We are pleased to report your results below:

Understanding your results.

Locus	DYS #	Alleles
1	393	13
2	390	25
3	19*	14
4	391	11
5	385a	11
6	385b	14
7	426	12
8	388	12
9	439	13
10	389-1	13
11	392	13
12	389-2	29

*Also known as DYS 394

Test	Expected*	Batch	Notes
Y-DNA37(Y-DNA13-25 Markers)	07/07/2006	152	
Y-DNA37(Y-DNA26-37 Markers)	07/07/2006	152	

* The above expected date is a target used by the lab. Actual date may vary by a few days.

A very small percentage of the tests do not return conclusive results during the first run. In other words, those samples did not produce a reading that would allow for our lab to determine with 100% certainty the values for one or more markers. When this happens we re-test the sample. This procedure is repeated up to 3 times after the initial test fails (one more time with Vial A, and if (the result is still inconclusive, 2 additional times with vial B). if (at the end of the process we cannot determine reliable results (extremely small percentage of cases), this is generally attributed to a poor scraping, in which case we send you vials C and D for a new scraping.

Recent Ancestral Origins

Welcome to the database of **RECENT ANCESTRAL ORIGINS (RAO)**. The results below show the ancestral origin of those you match or nearly match in the RAO. The ancestral origin information is provided by each testee, and is only as accurate as the testee's knowledge. Testees are instructed to answer "Unknown Origin" when their ancestor's origin is uncertain or not known.

Incorrect origins provided by testees may lead to search results that do not seem logical. for example: Assume your ancestors are from England, but your search results show the ancestral origin of your matches as England, France, AND one match shows an origin of Native American. Does that mean that your ancestors relatives may have lived in England and France? Yes. Does it mean that your ancestor was also a Native American? No. This means that a settler in America had a child with a Native American woman, the child was brought up as a Native American, and that, over time, the family has "forgotten" the European ancestor, and believe their ancestry to be Native American.

Over the span of generations people tend to move, as do borders, so nationality or ethnicity becomes subjective. for example, testees may enter Germany for ancestral origin, because the land of their ancestors is Germany today, but the land could have been held by Denmark for many centuries.

To see how your ancestral origin is recorded in our database, click on the link above entitled Update Contact Information. You may also update your paternal and maternal ancestral origin on the Update Contact Information page.

Exact matches show people who are the closest to you genetically. The Ancestral origin shows where they have reported to have lived. Since many persons migrated over the past few centuries, you will typically see matches in more than one country.

for information purposes, the Recent Ancestral Origin search also displays results for those who are near matches. A near match is either one step or two steps from your result. An exact match is 12/12 or 25/25. A one step match is 11/12 or 24/25 and the magnitude of the mismatch is 1. A two step match is 10/12 or 23/25 and the magnitude of both mismatches is 1, or it is 11/12 or 24/25 and the magnitude of the mismatch is 2. Near matches show where those who are distantly related to you have migrated over time.

Haplogroup

The predicted results below compare your Family Tree DNA Y-DNA STR test with the world-wide database of [Dr. Hammer](#) and customers who have had their SNP tested by us. The comparative [Haplogroups](#) shown below were confirmed by SNP (Single Nucleotide Polymorphism) tests at Dr. Hammer's lab, which uses the [YCC nomenclature](#). Haplogroups represent fractures in the tree and are tied to deep ancestry (think 10,000 or 10's of 1000's of years) and are shown in the human [Phylogenetic tree](#). Please note that countries in this database are listed by the place one came from or currently lives. The value therefore is that it tells researches about migratory patterns, and gives information about the age of the 'group' of people -- after all, everyone on the tree that isn't in Haplogroup A and B have lived outside of Africa for at least 60,000 years - and the story is how you got where you live now.

[Click here to order your wall chart of the haplotree for only \\$20](#)

"In studying the subject of DNA and human migration I had the opportunity to see the video and read the book: *The Journey of Man* by Spencer Wells. The [video](#) was very good, and the [book](#) was even better. In a word: Bravo! If you are interested in seeing or reading *The Journey of Man* follow the above links for your convenience, or visit or ["Books" page](#)".

Bennett Greenspan President & Founder, Family Tree DNA.

Haplogroup Test: your matches suggest that you belong to Haplogroup [R1b1](#), therefore you qualify to order our deep clade test which focuses on all mutations shown on the next screen after you click on the "Continue for more information" button. [Order](#) your Y-DNA SNP test for Deep Sub-clades.

Haplogroup Descriptions

R1 The undifferentiated R1 lineage is quite rare. It is found only at very low frequencies in Europe, Central Asia, and South Asia. This lineage possibly originated in Europe and then migrated east into Asia.

R1a The R1a lineage is believed to have originated in the Eurasian Steppes north of the Black & Caspian Seas. This lineage is thought to descend from a population of the Kurgan culture, known for the domestication of the horse (circa 3000 B.C.E.). These people were also believed to be the first speakers of the Indo-European language group. This lineage is found in central & western Asia, India, and in Slavic populations of Europe.

R1b Haplogroup R1b is the most common haplogroup in European populations. It is believed to have expanded throughout Europe as humans re-colonized after the last

glacial maximum 10-12 thousand years ago. This lineage is also the haplogroup containing the Atlantic modal haplotype.

R1b1 Haplogroup R1b1 is the most common haplogroup in European populations. It is believed to have expanded throughout Europe as humans re-colonized after the last glacial maximum 10-12 thousand years ago. This lineage is also the haplogroup containing the Atlantic modal haplotype.

Understanding your 12 markers

Your FTDNA Password: _____

Enclosed you will find a Certificate showing that you have had your Y chromosome DNA analyzed by Family Tree DNA. The results represent your actual allele values for 12 locations on the Y chromosome, and are listed on your Certificate. All 12 values are listed on your personal page at the web site. These alleles can be directly compared with other lab results by uploading your information to the public Y-DNA database at <http://www.ysearch.org/>.

These results can be compared to individuals to see how closely or distantly you may have shared that common ancestor. The rate of mutational change varies for each one of the markers. For illustration purposes, we are showing below a graph that takes into account those mutation rates. However, by referring to your personal page at Family Tree DNA you will be able to compare yourself to others that are a match or close match to you, using the FTDNATiP, which is our patent pending time predictor to the most common recent ancestor. To access your personal page, please log in from the MyFTDNA box at the right side of our home page www.familytreedna.com with your kit number and the password that we gave you at the top of this page.

Specifically for genealogists, if you match another person exactly with the same surname or a variant, you have a 99.9% likelihood of sharing a common ancestor with that person. This individual is described scientifically as the Most Recent Common Ancestor (MRCA). Population geneticists then apply a term known as the Most Likely Estimate (MLE) for the T (time) when your MRCA would have lived; however, that is an estimate and in each individual case the actual generation could be nearer or further from the person tested. For the purposes of scientific discussion, our population geneticist feels that 25 years best expresses a typical generation prior to the Dark Ages and 25 to 30 years per generation for the period thereafter.

Since we are all related to one another if we go back far enough in time, it is important to only consider very close matches when we are using DNA to resolve genealogical questions. We have supplied you with both a graph (page 1) and a table (page 3) to help you better understand the information given.

The Graph: we see 3 cases where a common ancestor is shared between two individuals. In the case of 12/12 (a perfect match) the common ancestor is considerably more recent. For that reason, many people who share a surname will share a perfect match. Many surnames are much older than a few hundred years and two people may share a surname but only match 11/12 or even 10/12. In these cases, as the graph shows, the MLE of when their MRCA lived could be much further back in time. Translation: you are related but probably much more distantly. Remember that due to the general scientific estimate of the change rate of the various locations of the Y chromosome this is not a precise science.

Because these mutations rates may vary between families, we provide a conservative estimate. While this may not be as satisfying it tends to error on the side of producing false negatives rather than the opposite. The science of DNA and genealogy is quite new and has been adapted from Anthropology where the MRCA is allowed to be more 'flexible'.

You are probably focusing on 'when' the MRCA actually lived. We have provided a table on the next page to help you better understand this scientific issue. The table, along with additional information available at our web site tells you, with statistical likelihood, the generation when your MRCA would have lived. The table looks at three points of the previous graph. For example, on a 12/12 match, there is a 50% probability that the MRCA lived no longer than 7 generations ago and a 90% probability that the MRCA lived no longer than 23 generations ago.

In the future, we hope to be able to bring forth examples of individuals related to famous persons in history so that researchers will be able to compare themselves. At that time we will begin to list those historical figures and their alleles on our web site for your comparison.

Bruce Walsh, Ph.D., noted population geneticist from the University of Arizona provides us with this information. An expert on population genetics and statistical applications and co-author of one of the leading texts in this area, Dr. Walsh sits on the **Family Tree DNA** advisory board. His calculations are the basis for most discussions on the subject of DNA and the Time to the MRCA for genealogy today. A more extensive list of calculations is available on our web site, as are additional graphs for your benefit.

Group "H" Jackson - Unknown Common Ancestor R1B1
Signature of this group has a good chance of
changing when Ftd 25400 (Stanley Jackson)
upgrades to 37 markers.

25400 - Stanley Jackson - 25 Marker Results: match 25
marker 61606 (Robert Barry Jackson) - matched in
23, 24 or loci, means a likelihood you have a common
ancestor - Haplogroup R1B1 Predicted.

Ancestors: Stanley Robt Jackson b. 1951 Mo. >
Robert Russell Jackson b. 1917 N.Y. > Stanley LeRoy
Jackson b. 1881 Ca > Robert B. Jackson 1863 Co.

Genetic Dist. of 1: Related [24 of 25 markers] with 25
signature marker of this group.

61606 Robert Barry Jackson 37 marker - Results - match 25
marker 25400 for FTDNA: R1B1
(this lineage also contains info on siblings for each of
the "direct line" Jacksons tested above (Elias - Olin) -
lucky person who matches! - Origin - England

As of March, 2010, Evyonne Eddins has resigned as administrator of this Project. The Project has grown to be more than two people can handle so additional co-administrators are being recruited. The Background, Goals, News and the Results pages are being updated. During this changing of the guard, the Y-DNA members' ancestral history is being reformatted and groups will be updated as they are prepared. Until a new co-administrator is trained, additional mtDNA and Family Finder results are not being listed on this page. (Contact Don Jackson or Mike Jackson for volunteer opportunities.)

Please use the "GEDCOM" link on your Y-DNA Matches page to upload a GEDCOM file and remember to use the "Click here to upload to Y-Search.org" to automatically join Y-Search and upload your results there once they are received.

=====

Once your Kit has been received, members can follow the progress of your testing by logging in at the FTDNA homepage using your Kit # and password. It is recommended members record the kit number and

password in a safe place. NOTE: Kits received MUST BE PAID IN FULL PRIOR TO SHIPMENT TO LAB.

The next step is the processing of member's sample at the lab. When the lab has completed the process, members will be notified via email by FTDNA.

FTDNA tests meet the highest standard for precision and reliability, which require individual verification by very skilled professionals. Therefore, typical time between the time when the kit goes to the lab for processing and the availability of results is:

12 Marker Y-DNA – 4 weeks

37 Marker Y-DNA – 6 weeks

67 Marker Y-DNA – 6 weeks

13-37 Marker Y-DNA Upgrade – 4 weeks

13-67 Marker Y-DNA Upgrade – 6 Weeks

mtDNA Tests – 5 Weeks

Kits go to the lab in BATCHES every week.

The above time frames are for tests that have a successful outcome from the first run at the lab.

Approximately 85% of the first runs are successful. The tests are rerun on the other 15% until a good result is obtained. Unfortunately, each rerun adds two weeks to the process. We understand that the delay is frustrating to participants. When a delay occurs, your kit is being rerun as many times as it takes to achieve a successful result.

It is highly recommended that you join the International Society of Genetic Genealogy at www.isogg.org. Membership is free and it is an excellent resource.

During your waiting period, it is highly suggested that you not only read all pages of the Jackson Group Project, join the ISOGG site, and go to the FTDNA homepage at www.familytreedna.com to gain as much knowledge regarding the varied aspects of DNA possible. By doing so, you will be prepared to understand your results along with the additional information given within your Personal Page when the results have been completed.

Once your results are in, take benefit of ALL links and symbols shown within your personal page. These links give you pertinent data and clues for further research regarding your ancestry. Should you match a SURNAME other than JACKSON, go back to the Jackson Project GOALS page and review the possibilities found to date, as to how this may have occurred.

Some links to pertinent websites have been posted within your group sections below for your convenience. Not all the information on these sites has been documented and no guarantee of accuracy can be given by FTDNA but the web sites are offered for your continued research. If you have a website you want listed here, please email one of the administrators. In the same vein, FTDNA cannot guarantee that all uplines provided by participants are documented. FTDNA does not verify participants' genealogy research but DNA results can verify or refute conjectured research.

2. MEMBERS WHO HAVE FOUND OR ON THE TRACK OF A COMMON ANCESTOR

Members of the following subgroups are helping each other with genealogical research toward the goal of finding a common ancestor.

GROUP 'A' JACKSON / PLANKENHORN LINEAGE - Haplotype R1b1b2: one member SNP tested to R1b1b2a1b4c

The SAMUEL JACKSON – CATHERINE MARY PLANKENHORN lineage of Chester Co., PA or Lame, Upper Glenam County, Antrim, Ireland – this group's unique 12 marker haplotype, 13,24,15,10,12,14,12,12,12,13,13,29, immediately separates these FTDNA members from others. Comparing the genealogy and Y-DNA of kits 37292 and 26633 one would conclude that kit 37292 is the ancestral haplotype of Samuel Jackson Jr. Kit 26633 matches kit 37292 at 66/67 with the mutation of 15 vs 14 at DYS 437. This mutation most likely occurred in recent generations and is considered to be

unimportant. This conclusion is based on the fact that kit 6132 (a descendant of William Jackson a brother of Samuel Jackson Jr.) has the ancestral value of 14 at DYS 437 and 14 is the modal value for the entire group. Further testing will be required in the William Jackson branch or another son of Samuel Jackson Sr. in order to prove the Samuel Sr.'s ancestral haplotype.

37292 – Gene Franklin Jackson – Y-DNA67 - RESULTS: This kit has the modal 67 marker values and is the probable ancestral haplotype.

Irvin Jackson b 1884 IN

...John W. Jackson b 1854

....Jacob A. Jackson b 1833 West River Township, Randolph Co. IN

.....Samuel Jackson III b 1796 Westfield, Stokes Co., NC

.....Samuel Jackson Jr. b 1758 Chester Co., PA

.....Samuel Jackson Sr. b ca 1730 Chester Co., PA or Lame, Upper Glenam County Antrim Ireland

PATERNAL COUNTRY OF ORIGIN: Most likely British Isles – GROUP MEMBER SINCE 6/16/05 – Y-Search Participant

26633 – Richard Harold Jackson – Y-DNA67 – RESULTS: 66/67 match to the modal signature of the group.

Charles Spurgeon Jackson b 1900 Wells Co., IN

...James Uriah Jackson b 1858 Wells Co., IN

....Samuel J. Jackson b 1834 Delaware Co., IN

.....James Hiram Jackson b 1785 Stokes Co., NC

.....Samuel Jackson Jr. b 1758 Chester Co., PA

.....Samuel Jackson Sr., b ca 1730 Chester Co., PA or Lame, Upper Glena County Antrim, Ireland

PATERNAL COUNTRY OF ORIGIN: Most likely British Isles - GROUP MEMBER SINCE 10/22/04 + Y-Search & Genographic Project Participant

62953 – Willis Conrad Jackson Y-DNA67 – RESULTS: 65/67 match to the modal signature of the group.

John Teddy Jackson b 1904 Weletka, Creek Nation Indian Territory (becoming Okfuskee County, OK), d 1959

...Marion Jackson b 1885 Cedar Co., MO; d 1929

PATERNAL COUNTRY OF ORIGIN: Most likely British Isles – GROUP MEMBER SINCE: 5/17/06

6132 – Montgomery "Monty" C. Jackson – Y-DNA67 - RESULTS: 63/67 match to the modal signature of the group.

Elvin Morris Jackson

..Allen Mason Jackson b 1898 Pauls Valley, Garvin, OK

....James Franklin Jackson

.....James William Jackson

.....John Jackson b 1805 Surry Co., NC

.....William Jackson b. 15 May 1767 Rowan Co., NC

.....Samuel Jackson, Sr. b circa 1730 Chester County PA or Lame, Upper Glenarm County Antrim, Ireland

PATERNAL COUNTRY OF ORIGIN: United Kingdom – GROUP MEMBER SINCE 3/14/03

105685 – Vincent R. Giles - Y-DNA67 - RESULTS: 65/67 match to the modal signature of the group.

Joseph Spencer; b 14 June 1862 Napon, Warwickshire, England

..William Giles; bap 14 Sept 1828 Buckingham, Buckinghamshire, England

PATERNAL COUNTRY OF ORIGIN: England – MEMBER SINCE: 11/28/2007 + Genographic Project

=====

GROUP 'B' DNA MATCHES TO ROBERT OF HEMPSTEAD, NY – Haplotype: I2b1 as of 24 Apr 2010, Deep Clade I testing is underway to determine if this group is I2b1c as suspected.

This group's unique 12 marker haplotype, 15,22,15,10,15,16,11,13,11,14,12,30, immediately separates these members from other Jackson lines. They appear to establish the 67 marker ancestral haplotype of Col. John Jackson the eldest son of Robert Jackson of Hempstead, Long Island, New York. There are now three distinct sub-groups: (#A) those who are proven (A1) or conjectured (A2) descendants of Robert Jackson with migrations out of NY and NJ; a second group (#B) whose DNA indicates a close relationship to the Hempstead Jacksons who are known (B1) or conjectured (B2) descendants of patriarch Samuel

Jackson who migrated out of Virginia; and (#C) a line whose earliest ancestor is known to have immigrated from England later than sub-groups A & B.

A1:

Descendants of Robert Jackson. All matches referenced to the ancestral haplotype of Col. John Jackson, the eldest son of Robert Jackson.

55891 – Frank M. Jackson – Y-DNA67 – RESULTS: This kit has the modal 67 marker values and is the probable ancestral haplotype.

Frank Fletcher Jackson b. 1881

..Frederick W. Jackson b. 1850

....Edward Jackson b. 1817 NY; d. 1864 Brooklyn, Kings Co., NY, m Mary Louia Anthony

PATERNAL COUNTRY OF ORIGIN: England - GROUP MEMBER SINCE 02/11/2010

GROUP 'C' - JACKSON / WILSON LINE – Haplotype I1b1

NOTE: The Common Ancestor of this group is WILLIAM JACKSON (1737-1792) m Margaret WILSON, of Guilford Co., NC. This group's unique 12 marker haplotype signature, 14.23.15.10.14.15.11.15.11.13.12.33, immediately separates these members from others. Kit 15184, a descendant of John Jackson, and kit 43808, a descendant of Andrew Jackson Jr., match 67/67 and to the 67 marker signature of this group and so probably still carry the ancestral haplotype of Andrew Jackson Sr. the son of William Jackson of Ireland. Deep Clade I testing is recommended for this group to determine finer haplotype designation.

15184 – Howard M. Jackson – 67 Marker – Y-Search - RESULTS: This kit has the modal 67 marker values and is the probable ancestral haplotype.

James A. Jackson d Scott Co., MO

..John Jackson b 1797 Salisbury Dist, Guilford Co., TN; d aft 1870 in maybe Scott Co., MO

PATERNAL COUNTRY OF ORIGIN: England – MEMBER SINCE: 4/24/2008 + GenoGraphic Participant.

=====

**GROUP 'D' - CHURCHWELL JACKSON LINEAGE – Haplotype R1b1b2
(one member SNP tested to R1b1b2a1b4)**

This Jackson Group's haplotype signature is [13-24-13-10-11-14-12-12-11-13-13-29].

NOTE: This Jackson Group shown below has yet to determine their Common Ancestor. Kits N3392, 86676 and 89187 match the modal signature of the group 67/67. CHURCHWELL JACKSON appears to be of the Thomas Jackson, Sr. family, but no exact set of parents have been found. There is a deed from 1768 in Albermarle County, VA, where Churchwell and Mary Fargason are selling 200 acres of land. This land is in the Pritties Creek area, where other Jacksons of this line are found. Churchwell is said to be of NC in this deed. Churchwell was born 1758 in Orange Co., VA. Orange and Albemarle Counties join each other. Churchwell is found in the Battle of Kings Mountain during the American Revolution. He is found in Anderson Co., TN, and is found in a land grant located on the Cumberland Mountain, TN in 1830. He died in Marion County, TN sometime after 1855 when the land on Cumberland Mountain was sold.

NOTE: This Churchwell-Jackson Group is interesting in that DNA has matched the group with surnames of SINCLAIR, BLACK and HENRY. According to BLACK family lore, the surname was changed from Jackson

during religious violence in Scotland to escape persecution. (See the explanation given by the owner of Kit 51855 below.) It was at this time that the Protestant Presbyterian Church was getting its start. More than likely these families took surnames of the wife or friends living within the same area or even to other surnames not being persecuted by the Catholic Church for their family's safety. Some Jackson families may have escaped from the area taking the varied surnames, then went back to their birth right after moving elsewhere, while others retained their "new" surname. Also, take note that within the Kit #12604 the ancestral home was located in Scotland; where Kit #48976, the ancestral home was located on Shelton Island. Testees of both kits reside in each area. It is also possible that men from this Jackson group, as well as their Henry and Sinclair matches, are descended from a common male ancestor who lived in Scotland before surnames were commonly adopted. Men often adopted the surname of a local leader, and this progenitor's descendants may have been widely dispersed enough to adopt these different surnames when that became the custom. Visit the following web-site for further guidance:

The following Kits within this Jackson Group match at 37 markers to the Jackson surname as well as three other surnames as follows:

.....46298, 61325, N3392 and 7020 – JACKSON with matches to BLACK, HENRY & SINCLAIR surnames
12604 – JACKSON with match to the BLACK surname
51855 – BLACK with matches to JACKSON & HENRY surnames
46976 – HENRY with match to the JACKSON, BLACK and SINCLAIR surnames. Note: So far, this group does not have a member with the "Sinclair" surname nor a single member solely matching the "Sinclair" or the "Jackson" surname to compare.

Thus, one may speculate that this group could consist of several lines from the "Common JACKSON Ancestor":

Unknown JACKSON (Probable original common ancestral surname)
Jacksons who took the surnames of BLACK, HENRY or SINCLAIR
Jacksons who RETAINED the surname of BLACK & HENRY
Jacksons who RETAINED the surname of HENRY
Jacksons who RETAINED the surname of BLACK
Jacksons who RETAINED the surname of SINCLAIR
Jacksons who RETAINED the surname of HOLLOWAY
Jacksons who RETAINED OR REVERTED BACK to the surname of JACKSON
 =====

N3392 – Charles Marion Jackson – Y-DNA67 Marker + Genographic Project Conversion – RESULTS: This kit has the modal 67 marker values and is the probable ancestral haplotype.

Marion Wakefield Jackson b. Nov 29, 1907 Woodland or Pontotoc, MS; d. Oct 12 1983

..Marion Shackleford Jackson b. Sept 17, 1881 Woodland or Pontotoc, MS; d. June 15, 1961 Planade, CA

GROUP 'E' - JOHN JACKSON – died c. 1713 – COLONY OF VA – Haplotype I1

As of April 2010 only two of eleven kits, N29547 and 28701, have traced to a common ancestor; Ambrose Jackson, son of John Jackson who died about 1713 Colony of VA. The other nine participants are attempting to find a common ancestor with other members of the group. 35/37 of Ambrose Jackson's markers may be inferred, with his values for DYS 385a and CDYb yet to be determined. This group's unique 12 marker haplotype is 13,22,14,10,13,14,11,14,12,12,11,28.

Five members match the 37 marker modals for the group. Three members have 67 markers as of April 2010, so a probable 67 marker modal has been established.

N29547 – Stephen Lamar Jackson - Y-DNA67 – RESULTS: This kit has the modal 67 marker values and is

the probable ancestral haplotype, and exhibits the probable 35 marker ancestral haplotype of Ambrose Jackson.

GROUP 'F' - John B. Jackson (1774 NC-aft 1850) – Haplotype R1b1b2

This group has a unique 12 marker Haplotype of 13,24,14,11,11,13,12,12,12,13,13,29 and a deduced
ancestral haplotype of 36 markers with DYS 464d being uncertain. The ancestral haplotype is that of William
Penn Jackson, the son of John B. Jackson. An upgrade to 67 markers is advised for kit 71115 to further
develop the ancestral haplotype of William Penn Jackson, and Deep Clade – R testing is suggested to
further refine its haplogroup. This group exemplifies the need for higher level tests in R1b, as kit 71576 is a
GD of 1 to group UNK Common – V at 12 markers, and a GD of 12 at 37 markers.

71576 – Dr. Durward Pressley Jackson - Y-DNA67 – RESULTS: This kit has the modal 67 marker values and is the probable ancestral haplotype. This kit also has 66/67 marker matches with the surnames MC DOWELL and MC DOUGAL.

Erby Lorenzo Jackson b. 6/8/1898 Randolph Co., AL; d. May 1975 Hartsville, SC

GROUP 'G' - William Jackson b. abt 1760 Possibly Scotland Haplotype I1

This Jackson Group's 12 marker Haplotype signature 13,23,14,10,14,15,11,14,11,12,11,28 separates these two FTDNA members from others. Kits 168075 and 154352 match 37/37 in all loci which means that there is a 99% likelihood that they share a common ancestor. The two haplotypes indicate the ancestral haplotype of John Jackson, a son of William Jackson b. 1761. The family of Glen Jackson, kit 168075 has a Bible printed in Edinburgh, Scotland by Adrian Watkins, His Majesty's Printer between 1747 and 1760. Several hand written notes on four pages are as follows:

On what appears to be the title page of the Bible

"Andrew Pearsall Jackson was born January the 26th ?? 1828."

On a blank page

"Garrett was born the ??th December 1782"

"William Jackson, the son of William & Margret Jackson was born October 30 1788

"Mary Nancy Jackson was born November the 14 1790"

"Ann Jackson was born March the 3 1793"

"John Jackson was born March (?) the 28th 1795"

"James Jackson was born August 7th 1797

On the bottom of a page that is identified "The End of the Old Testament"

"Jeremiah Jackson, son of Wm Jackson and Margaret his wife was Born on the 5th day of december in the year of our Lord 1801

On another blank page

"Haz??? the daughter and Margaret was born the eighth day of February ?????"

"Rachel upon the tenth day of December 1781"

"Elizabeth upon the tenth day of July 17???"

"Margaret Pearsall was born January 2, "

"William was born October 30 1788"

"Nancy Jackson was born November the 14 ?????"

"Ann was born March the 3 1793"

168075 - Glen Harold Jackson –Y-DNA37 – RESULTS: This kit has the modal 37 marker values and is the probable ancestral haplotype.

GROUP 'I' Thomas Jackson of Robeson Co., NC – Haplotype: WAMH/R1b1b2

Note: The common ancestor of this group is Cornelius Jackson son of Thomas Jackson. Their 12 marker haplotype is 13,24,14,11,11,14,12,12,11,13,13,29. Kits 45160 and 47349 match 37/37 and have determined the ancestral haplotype of Cornelius via his two sons Andrew and Dunkin. No members have 67 markers, which are recommended for haplogroup R1b1b2/WAMH members, and none have done Deep Clade – R testing which is suggested.

45160 – Gregory Allan Jackson – Y-DNA37 – RESULTS: This kit has the modal 37 marker values and is the probable ancestral haplotype.

=====

GROUP M – Jesse Jackson 1825-1879 TN to TX

This group has a unique 12 marker Haplotype signature [13,22,14,10,14,15,11,14,11,12,12,28]. The first
segment of 12 markers are very important, especially those with one or two mutations within this first
segment.

The earliest DNA proven ancestor is JESSE JACKSON (1825-1879); however, these two members seem to
have a female Jackson (possibly daughter of David Jackson, Jr.) associated with/married to a male
CHILDRESS or CREED surname, with children retaining or reverting to the JACKSON surname.

7722 – John Jackson c/o Trellys Erwin – Y-DNA67 Marker – RESULTS: This kit has the modal 67 marker
values and is the probable ancestral haplotype. and CHILDRESS and CREED surnames

John Jackson b 29 Jun 1916 Grady Co., OK; d 12 Jul 2005 Ventura Co., CA

.. Sam Houston Jackson b Jun 1867 Delta Co., TX; d 3 Feb 1921 Grady Co., OK

.... Jesse Jackson b 1825 Madison Co., TN; d Mar 1879 Delta Co. TX

(NOTE: From this point, DNA matches the surname of CHILDRESS and CREED, but paper trail supports
the JACKSON surname)

..... David Jackson, Jr. b 1798 Anson Co., NC; d 21 May 1872 Delta Co., TX

..... David Jackson, Sr. b abt 1758 Anson Co., NC; d 1823 Madison Co., TN

..... Benjamin Jackson b 26 1719 Long Island, NY; d 1805 Chesterfield Dist. SC

PATERNAL COUNTRY OF ORIGIN (Unknown); MEMBER SINCE: – 6/27/08

3. UNKNOWN COMMON ANCESTOR GROUPS

Each of the following alphabetical groups should work together to find a Common Ancestor. When one or more members within these Groups identify a link to one or more of the members, the entire Group will be moved to that lineage (which all can work toward). At that point the entire group will no longer be shown within an "Unknown Common Ancestor", but will be moved to reflect the connection, and will be given an alphabetical group designation. This has recently happened, thus the addition of "Group O – Thomas Jackson Sr. abt 1730-1809" being formed. When this happens, the color coding shown within the Y-Results page will change, with the "alpha letter" Group Identification changing for some of the Groups, or possibly all, depending which "alpha letter" is affected.

GROUP 'A' - UNKNOWN COMMON ANCESTOR – Haplotype R

The first 12 markers of this Group are considered to have a unique haplotype signature of [13-24-15-11-11-14-12-12-11-13-13-29].

132208 Thomas Howard Jackson - Y-DNA37 - RESULTS: 35/37 match to the modal signature of the group. At 37 markers the closest match to another project member is a GD -10 to 72590 Paul L Jackson, a member of "Group 'R' Unknown Common Ancestor – Haplotype R"..

Thomas Howard Jackson Sr, b 25 Jun 1880 Baltimore(City) MD; d 17 Jul 1954 Baltimore(City) MD, m Sadie Alma Hardwick

..James Knox Polk Jackson; b 26 Jun 1844 Baltimore(City) MD; d 20 Jan 1916 Baltimore(City) MD, m Laura Jane Walmsley

....James Roberts Jackson; b 1819 PA; d 24 Sep 1851 Baltimore(City) MD, m Sarah Ann Bowers

=====

**GROUP 'J' - UNKNOWN COMMON ANCESTOR – Haplotype R1b1b2
(one member Deep SNP-R1b tested to R1b1b2a1a/U106)**

The first 12 markers of this Group are considered to have a unique haplotype signature of [13-23-14-11-11-14-12-12-13-13-29]. Nine men in this group match the signature. Eleven more in the Jackson project are within a genetic distance of one, so may be related within a genealogical timeframe. However, some members have higher level matches only to other surnames. Since this group has the Western Atlantic Modal Haplotype (WAMH), it is strongly recommended that more members do Deep Clade – R testing, and test SNPs downstream of U106. All members should upgrade to at least 37, and preferably to 67 markers as mutations within the subgroups will be useful in determining family branches. The first two kits have a known common ancestor but whether all the rest can be assumed to belong to that same ancestor or if they are all descended from an earlier ancestor is at this time uncertain.

171877 – William Redfern Jackson III – Y-DNA12 – RESULTS: 12/12 match to the modal signature of the group.

Lineage submitted by Jerry Lowman and Janie Kimble: Known 2nd cousin once removed to Hugh Albert Jackson kit 153426.

William Redfern Jackson Jr.

GROUP 'K' - UNKNOWN COMMON ANCESTOR – Haplotype I

The first 12 markers of this Group are considered to have a unique haplotype signature of [13-22-14-10-14-15-11-14-11-12-11-29]. It is highly recommended this N36327 test at a minimum of 37 markers in order to secure a more secure result.

N36327 – Gregory Lee Beavers – Y-DNA25 – RESULTS: This kit has the modal 25 marker values and is the probable ancestral haplotype.

William Russell Beavers b. 8/31/1920; d. 9/9/1973 Fulton Co. GA

..Greer Cleveland Beavers b. 9/14/1884 Fulton Co., GA; d. 2/21/1954 Fulton Co., GA

....Elbert Beavers b. 12/19/1838 Cobb Co., GA; d. Fulton Co., GA

.....Alsey Beavers b. 1783 North Carolina; d. bef. 1870 m. 3/15/1833

.....William Walter Beavers b. 7/25/1755 Glamorgan, Wales; d. abt 1808 Elbert, Wilkes Co., GA

PATERNAL COUNTRY OF ORIGIN: Wales – GROUP MEMBER SINCE: 9/22/06 - Genographic Project and Y-Search Participant

59266 – Bobby Jackson – Y-DNA67 – RESULTS: 66/67 match to the modal signature of the group. There is no match with the Jackson surname at the 67 marker level – but there is a genetic distance of 4 to Donald Lee Beavers which indicates a 74.96% probability of a shared ancestor within the last 12 generations.

Charlie J. Jackson b. Mar 28, 1894 Hopkins Co., TX; d. June 28 1984 Greenville, Hunt Co., TX

..William Merion Jackson b 1865 Middle TN possibly Putnam, TN; d 1951 Fort Worth, Tarrant, TX; m Nancy Jackson

....Unknown Walker m. Martha Jackson (1836-bef. 1800) dau of Newell and Anna Grant Jackson

.....Andrew Jackson (1770-1850) m. Nancy Bridges

.....William Jackson (1730-1790)

NOTE: William Merion Jackson, was the son of Martha Jackson who was the niece of Andrew Jackson b.

1803 and daughter of Andrew's brother, Newell Jackson: Two Jackson FTDNA MEMBERS (Kits #59266

[UNK Common "K" Group] and 43808 [Jackson/Wilson Group] each within a different DNA matched Group

has been found to a link to a common ancestor being Andrew Jackson (1770-1850) within Kit #43808

through the DAUGHTER of Newell and Anna Grant Jackson, Martha Jackson (1836-bef. 1880 Putnam Co.,

TN. Martha had unknown Spouse (probably Mr. ? Walker; with this union taking place after 1860. Marriage

record not found within Putnam Co., TN), and had two children William M. and John L. (Walker?) Jackson.

Martha had a #2 marriage to John Inman between 1871 and 1874. After their mother's death (late 1874-bef.

1800) her two sons were found living within the household of Martha's brother, Levi Jackson in 1880.

Sometime after 1800, William M. and John L ran away from their Uncle Levi's home, leaving Putnam Co.,

TN with a Jackson family (possibly w/Andrew Thomas Jackson, Jr. family as well as the wife and children of

Josiah Jackson, migrating to Texas where both boys married sisters in 1894 in Hunt Co., TX, who were the

daughters of Josiah and Julianna Walker Jackson. Josiah Jackson had earlier scrambled from Putnam

County, TN to Texas after killing his brother-in-law. Julianna Walker Jackson destroyed all family records of

her brother ever existing. It then becomes clear why Martha Jackson, and her sons, William M. and John L.,

reverted back to the Jackson maiden name as shown within the 1870 census, and why the Walker family

records of Julianna's brother do not exist. (Nancy, wife of William Merion, was the dau of Josiah and

Julianna Walker Jackson) b. May 25, 1871 Middle TN, d. Sept 18, 1889 Ft. Worth, Tarrant Co., TX.

GROUP 'V' – UNKNOWN COMMON ANCESTOR – Haplotype R1b1b2

The first 12 markers of this Group are considered to have a unique haplotype signature of [13-24-14-11-11-14-12-12-12-13-13-29]. These kits are in a common R1b1b2 group which is known for being uncertain at the 12 marker level. Though members may appear to be connected at the 12 marker level, that connection may fall apart at the 37 or 67 marker level which demonstrates that they are not related within a genealogical time frame. An upgrade to 37 or 67 markers is highly recommended for greater understanding. An example: kit 33864 is a genetic distance of 1 to four Jackson kits in this group, but that does not hold true at the 37 marker level. At the 37 marker level there were no matches to Jackson surname but there was a genetic distance of 2 to four kits with surname of Harrell.

N23818 and 146538 duplicate testing – Gary Kemuel Jackson – National Genographic Project transfer – Y-DNA37 - RESULTS: 30/37 match to the modal signature of the group. At the 37 marker level there are no close matches to Jackson or any other surname.
